L10 ANSWER 1 OF 140 MEDLINE on STN  
TI Contraceptive vaccines.

L10 ANSWER 2 OF 140 MEDLINE on STN  
TI Targeted disruption of luteinizing hormone beta-subunit leads to hypogonadism, defects in gonadal steroidogenesis, and infertility.

L10 ANSWER 3 OF 140 MEDLINE on STN  
TI Molecular targets for immunocontraception.

L10 ANSWER 4 OF 140 MEDLINE on STN  
TI Intranasal LHRH agonist (Buserelin) after ovulation: a post-coital contraceptive approach.

L10 ANSWER 5 OF 140 MEDLINE on STN  
TI Inhibition of progestational activity for fertility regulation.

L10 ANSWER 6 OF 140 MEDLINE on STN  
TI Pregnancy vaccine research.

L10 ANSWER 7 OF 140 MEDLINE on STN  
TI Obstacles impede development of contraceptive vaccine.

L10 ANSWER 8 OF 140 MEDLINE on STN  
TI [Regulation of fertility by anti-hCG vaccines].  
Regulation de la fertilite par les vaccins anti-hCG.

L10 ANSWER 9 OF 140 MEDLINE on STN  
TI [Amenorrhea following the administration of oral contraceptives].  
Amenorrea despues de la administracion de contraceptivos orales.

L10 ANSWER 10 OF 140 MEDLINE on STN  
TI Management of post-pill amenorrhea.

L10 ANSWER 11 OF 140 MEDLINE on STN  
TI Fertility regulation technology: status and prospects.

L10 ANSWER 12 OF 140 MEDLINE on STN  
TI Minimal stimulation IVF using clomiphene citrate and oral contraceptive pill pretreatment for LH suppression.

L10 ANSWER 13 OF 140 MEDLINE on STN

TI Vaccines and passive immunological approaches for the control of fertility and hormone-dependent cancers.

L10 ANSWER 14 OF 140 MEDLINE on STN

TI Prior immunity to a carrier enhances antibody responses to hCG in recipients of an hCG-carrier conjugate vaccine.

L10 ANSWER 15 OF 140 MEDLINE on STN

TI Time of implantation of the conceptus and loss of pregnancy.

AN 94:566075 PROMT

TI Leading Contraceptive Vaccines Are Specific to Chorionic Gonadotropin

SO Genesis Report-Rx, (Oct 1994) pp. N/A.  
ISSN: 1061-2270.

LA English

WC 754

TX The three major types of birth control vaccines would be specific to:

- \* The pregnancy hormone human chorionic gonadotro- pin (hCG)
- \* Sperm, zygote, and early embryo
- \* Gonadotropin-releasing hormone (GNRH)

The only contraceptive vaccines to have entered human clini- cal trials use hCG as an antigen. Prototype anti-hCG vaccines are now in Phase II clinical testing as part of an international collaborative effort.

Vernon Stevens, a leading fertility researcher at the Division of Reproductive Biology at Ohio State University (Colum- bus, OH), explained the rationale of hCG vaccines. "HCG is formed very early after the fertilized egg starts to develop, and it's even present in the uterine fluids, where it's secreted by the developing egg. It's called blastocyst state. After implanta- tion of the blastocyst, hCG is secreted very rapidly into the bloodstream and urine. And, we know that if we immunize female baboons with this antigen, which has a cross-reaction with the baboon's CG at a low percentage, this is apparently enough to block pregnancy. We knew that a good 20 years ago. Of course, the big problem facing us was that if you were to make antibodies to hCG in a rabbit or some animal, that you get cross-reaction with other hormones, particularly luteiniz- ing hormones."

Stevens said the first clinical trials of an hCG vaccine, which were initiated in Australia in 1987, foundered on one problem: women had to be vaccinated as frequently as every 3 months. Said Stevens, "The particular delivery system was an emul-

sion made up like Freund's (emulsion) that required you to give rather frequent injections to maintain high levels of antibody. So, it was decided by the committees of WHO that that wouldn't be a practical application."

A variety of other approaches to immunizing against hCG have since been investigated. The most advanced approach, which has entered Phase II clinical trials, is based on conju- gates incorporating tetanus or diphtheria toxoid as carriers linked to hCG-based peptides centered on the beta-subunit of the hCG molecule. This vaccine consists of a heterospecies dimer (HSD, beta hCG associated with an alpha-subunit of ovine luteinizing hormone, beta hCG:alpha oLH) of hCG. These vaccines prevent or interrupt pregnancy at the peri -implantation stage by theoretically neutralizing the luteotrophic effect of hCG. The most refined vaccine is directed against the unique C-terminal peptide on the beta-subunit of hCG. This vaccine provokes antibodies specific for hCG and

does not cross-react with human luteinizing hormone (hLH).

Preclinical studies in baboons and data from Phase I human trials indicate that this method is practically free of side effects, remains effective for up to 12 months, and is capable of stimulating the production of anti-hCG antibodies. The vaccine has recently passed an important milestone by completing the first leg of Phase II efficacy trials. Women of proven fertility with active sexual lives were protected from pregnancy at antibody titers of 50 ng/ml after a combined total of 179 menstrual cycles. The hCG vaccine has entered Phase II clinical trials in three centers in India after successfully completing Phase I clinical studies in several centers in India and four other countries.

This vaccine has already been demonstrated to be reversible in its effect. Further, it produces no notable side effects on the endocrine, cardiovascular, and other systems. Ovulation was not disturbed, and menstrual regularity was maintained.

Other types of hCG vaccines are also being investigated. A live recombinant vaccine has been made that elicits high anti-hCG titers in monkeys for nearly 2 years following primary immunization and a booster at 8 to 9 months. In addition, clinical trials being conducted in Stockholm, Sweden, are expected to produce efficacy data late in 1994 on a vaccine formulation developed by Stevens.

The disadvantage some hCG vaccines have of requiring frequent injections may be solved by encapsulating the vaccine in biodegradable microspheres, which could be given at a single contact point for sustained antibody titers of more than a year. Stevens said, "We hope to, by the end of this year, start a Phase I clinical trial using the same basic ingredients that were in the first vaccine, but delivered in the microspheres. If we get combined good efficacy data in the Phase II that's going on with the original vaccine, and if we get long-lasting, at least a year, titers in Phase I second vaccine, then we feel that's practical."

However, it should be emphasized that until Phase III clinicals are conducted, the efficacy, long-term safety, and consequences of conferring hCG immunity will be unknown.
